The Eastern Iowa DX Bulletin

Number 272, May 2, 2025

Craig Fastenow, KØCF, Editor

This bulletin is a compilation of **currently active** DX operations (or those that will become active within the current week) from recent issues of the three DX bulletins listed below and other sources. Credit for the source is given at the end of each article.

Articles are ordered by the entity's callsign prefix from the *ARRL DXCC Entities List*. Callsigns used are in **bold** with dates of operation highlighted in **red**. Clickable links are provided for QSL and other information wherever possible. Note that articles may be edited for grammar, language, style and accuracy and will remain in *The Bulletin* while active; articles that are announcements of ongoing operations, or that have no specified end date, will be removed after three weeks.

Also included is a [Propagation](#) section, updated daily; and a [Contest Calendar](#) of upcoming popular contests.

V8, BRUNEI. DJ, **V85NPV** has been active on 20 meters using CW around 1500z. QSL via [LZ2HI](#).

-[ARRL DX Bulletin # 16 April 17, 2025] (0418-0509)

VE, CANADA. Mark, VO1ONE/N8TLV will be active as **VYØSAT** from Gjoa Haven, King William Island (NA-131) from April 30th to May 3rd. He will be active on satellite (both linear and FM, no digital) and on 20-10 meters, primarily SSB and FT8. Satellite passes will be announced on <https://hams.at/> and <https://x.com/vo1one>. QSL via LoTW and [N8TLV](#).

-[425DXN # 1772 April 19, 2025] (0425-0509)

VR, HONG KONG. Members of the Hong Kong Amateur Radio Transmitting Society are active with special call sign **VR1ØØIARU** until December to celebrate the centenary of the IARU. QSL via the bureau.

-[ARRL DX Bulletin # 18 May 1, 2025] (0502-0523)

XU, CAMBODIA. Thomas, DL7BO is QRV as **XU7O**. Activity is on the HF bands. His length of stay is unknown. QSL direct to DL4WK.

-[ARRL DX Bulletin # 16 April 17, 2025] (0418-0509)

YL, LATVIA. Special event station **YL35G** marks the anniversary of re-established Latvian independence from May 4th onwards. QSL via YL3GBC.

-[DXNL # 2456 April 30, 2025] (0502-0523)

YS, EL SALVADOR. Renato, PY8WW will be active as **YS3/PY8WW** from Isla Zacatillo (NA-190), El Salvador on May 8th-13th. He will be QRV on 80-6 meters with two stations at the same time - one station alternating between SSB and CW, and the other one fully dedicated to FT8 (F/H) and FT4. QSL via ClubLog's OQRS.

-[425DXN # 1773 April 26, 2025] (0502-0516)

Z3, NORTH MACEDONIA. Celebrating IARU's centenary, members of the Radioamateur Society of Macedonia (Z37RSM) will be active as **Z31ØØIARU** until May 18th. QSL via LoTW, eQSL, QRZ Logbook.

-[425DXN # 1769 March 29, 2025] (0328-0516)

ZP, PARAGUAY. DK4TC, Tom, signs **ZP8/DL4TC** from Santa Rosa Misiones during April and May. QSL via Bureau, eQSL, LoTW.

-[DXNL # 2455 April 23, 2025] (0425-0530)

ZS8, PRINCE EDWARD & MARION IS. Yuris, YL2GM is QRV as **ZS8W** from Marion Island until May 16th while on work assignment. Activity is in his spare time on 160 to 6 meters using CW, SSB, and FT8. See <https://www.lral.lv/zs8w/> for more information. QSL via ClubLog's OQRS, or direct to YL2GN.

Propagation (Updated daily)

The Weekly Solar Data chart plots Solar Flux Index (SFI), Sunspot number (SSN) and Planetary K-index (Kp) for the past 8 days. With 8 Planetary K-index readings each day, only the minimum, average

and maximum K-index values are plotted. **Note:** You may click [here](#) or on the chart above to see the same data for the past month.

The Daily Solar Flux Index, Sunspot number, Planetary K-index, Solar Flux predictions and Solar Flare data used in this bulletin have been collected by KØCF from from the U.S. Department of Commerce's NOAA Space Weather Prediction Center.

The propagation graphs above are the creations of KØCF and are unique in space weather reporting.

Please Note: The graphs are high resolution .PNG files which you may view in greater detail using your browser's "zoom" feature. Alternatively, right click on the graph and select "Open Image in New Tab" to enlarge it, or "Save Image As..." to save it to your computer for further analysis.

Propagation Summary

For the 8 day period from Friday, April 25th through yesterday, May 2nd.

The average solar flux was 152, down 10 points from the previous week, with a weekly high of 164 on Friday, April 25th, followed by a low of 148 on April 30th.

The average sunspot count was 101, down by 36 from last week, peaking at 172 on Saturday, April 26th followed by a weekly low of 38 on May 2nd.

The Planetary K-index weekly average was 3.2 with a maximum of 5.3 on Friday, May 2nd, indicating a minor geomagnetic storm.

Solar flare activity since April 26th has been quiet with only 4 major flares, the largest of which was an M 2.0 event on Wednesday, April 30th.

Propagation Data

Major solar flares, Saturday, April 26th through 1318 UTC, May 3rd.

Global D Region Absorption

Conditions in the D-region of the ionosphere have a dramatic effect on HF communications. The D-Region Absorption map combines the effects of solar particles and photons. Yellow to red colors on the map depict increasing signal attenuation, where the bar chart at the right displays attenuation versus frequency. Click the thumbnail below for an animated map of D-Region Absorption:

The Aurora Borealis

The aurora is not only beautiful to see but can have a profound impact on HF and VHF radio propagation. For the HF operator, auroras can result in a complete shut-down of propagation. However, on VHF, auroras present interesting DX possibilities. Beam antennas are very desirable and should be pointed north, towards the aurora. Signals are reflected by “back-scatter” and will be distorted with a rough buzz. SSB is the best voice mode to use, but copy can be difficult. CW will have a rough buzzy sound but be perfectly copyable. Click the thumbnail below for an animated map of aurora versus time:

Solar Wind Storm in Progress

Earth has entered a stream of fast-moving solar wind with gusts reaching 700 km/s (1.6 million mph). [G1](#)-class geomagnetic storms and high latitude auroras are possible on May 3rd.

A Very Big Sunspot

How big is it? Sunspot 4079 is, by far, the biggest sunspot of 2025. It stretches 140,000 km across the solar disk and covers an area equal to 50% of [Carrington's sunspot](#) in 1859. Amateur astronomer Eduardo Schaberger Poupeau of Rafaela, Argentina, peered into the sunspot's dark heart on May 2nd, and this is what he saw:

The two jet-black cores are each large enough to swallow Earth. They are bristling with hair-like solar fibrils as much as 20 thousand km long. Fibrils are, essentially, magnetic tubes that guide hot plasma in and out of the sunspot. When they start to wave back and forth, it means the sunspot is becoming unstable and about to erupt. [Videos of the sunspot](#) show dynamic activity within these structures.

Any solar flares this weekend will be geoeffective as the giant sunspot turns toward Earth.

A Propagation Tutorial

The solar X-ray flux tracks solar activity and solar flares. Solar flux, which can vary from as low as 50 to as high as 300, influences the level of ionization in the F2 region of the ionosphere, providing a very good prediction of HF DX conditions. The higher the solar flux, the better conditions will be for the higher HF frequencies and even 6 meters. However, the levels need to be maintained for some days to allow ionization in the F2 layer to build up. A solar flux of 150 results in good HF band conditions, while levels of 200 and up can provide great conditions.

Large X-ray flares on the sun can increase the ionization of the D layer of the ionosphere (a lower layer) on the sunlit side of the Earth, greatly attenuating or blocking HF radio transmissions for up to a half hour. Solar flares often produce Coronal Mass Ejections (CMEs) which, if Earth directed, can lead

to geomagnetic storms. Some large flares are also accompanied by strong radio bursts that may interfere with other radio frequencies and cause problems for satellite communication and radio navigation (GPS).

The Planetary K-index is a measure of the magnitude of geomagnetic storms and is an excellent indicator of disturbances in the Earth's magnetic field. A level of 1 or 2 represents quiet geomagnetic conditions; a reading of 3 or 4 may cause some propagation deterioration; 5 and 6 are minor to moderate geomagnetic storms; and 7 to 9 are strong, severe, and extreme storm conditions. Strong geomagnetic storms can trigger Auroral displays and cause HF radio blackouts. Higher geomagnetic activity also has the adverse effect of lowering maximum usable frequencies, much like lower solar flux does.

For best conditions, the solar flux should be above 150 for a few days with the K index below 2. When these conditions are met, some good DX is likely!
